Cross-domain performance optimization, process automation & security

5G SA-2

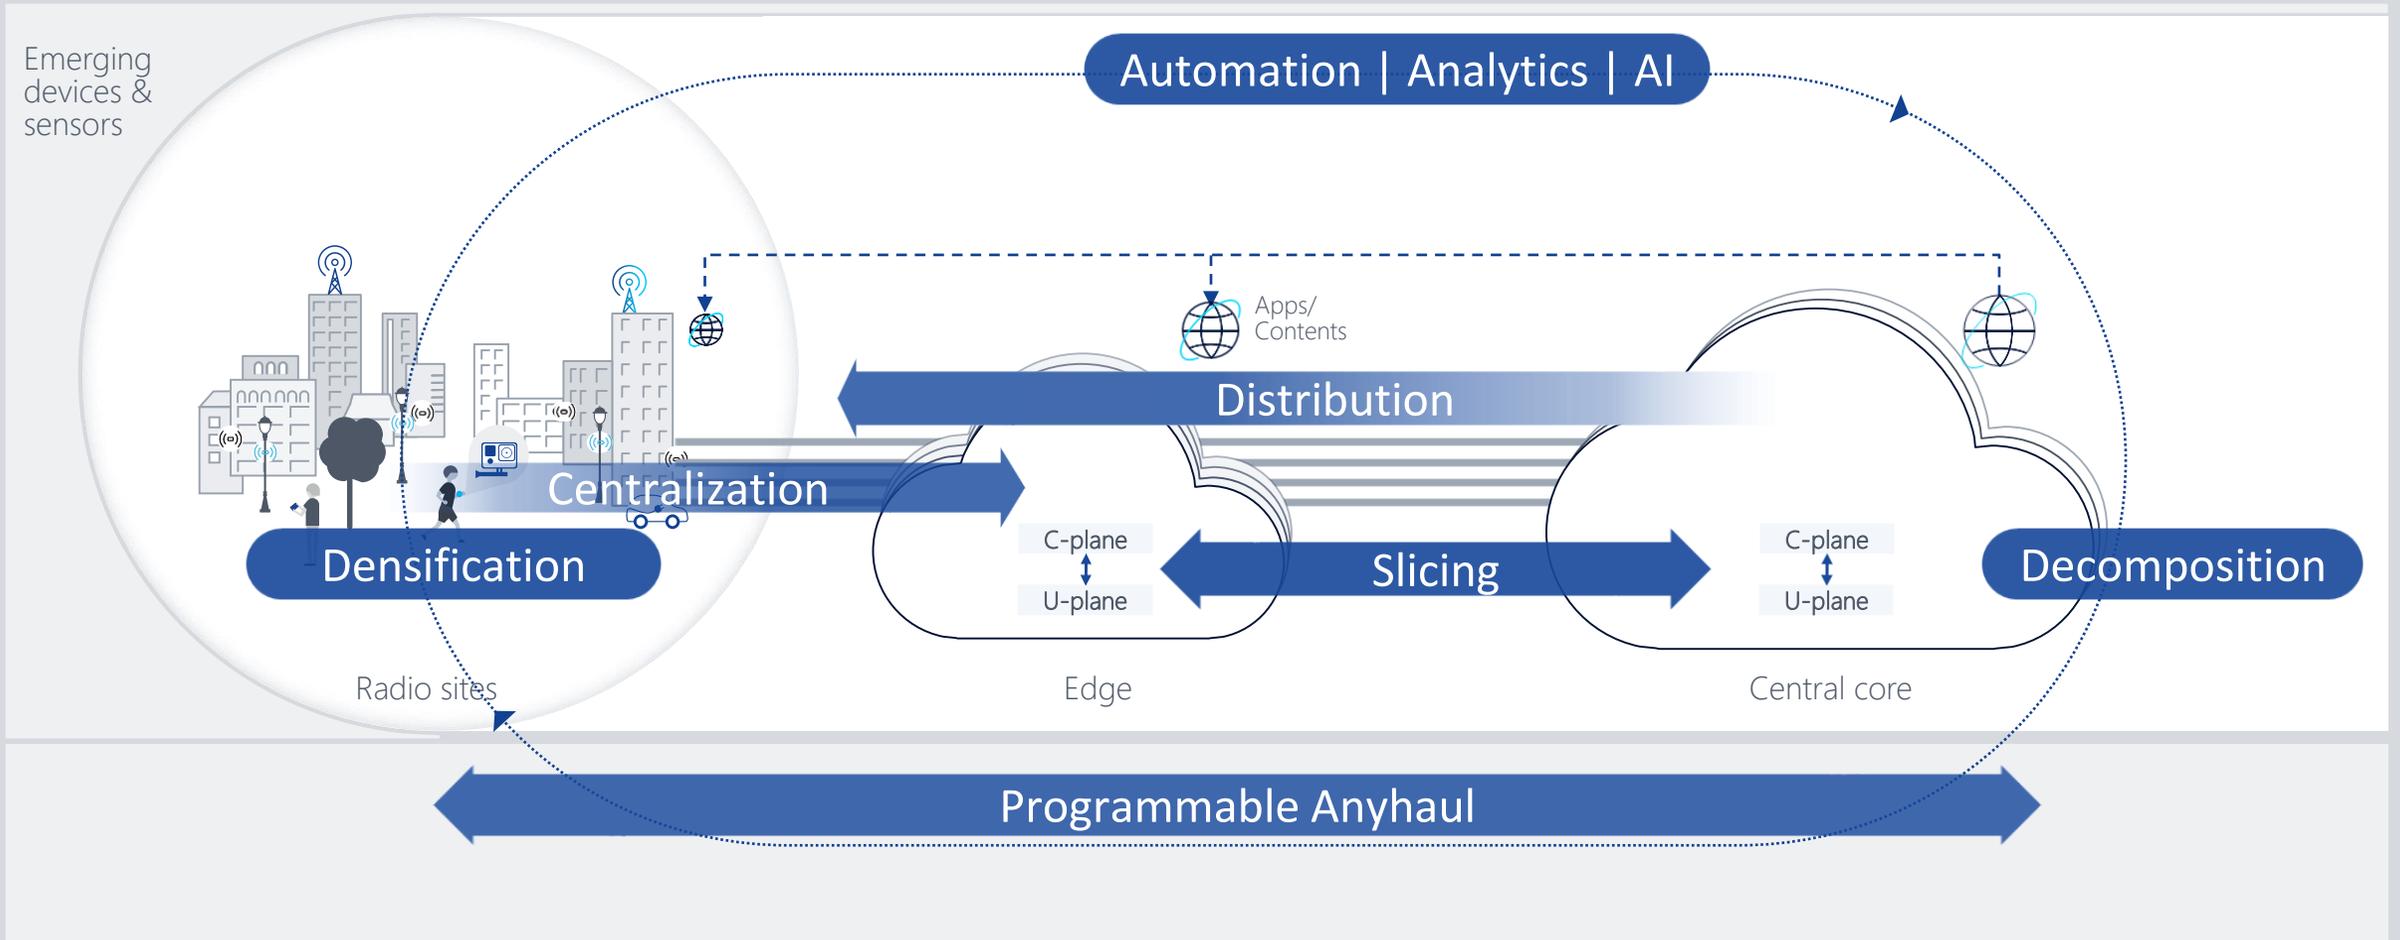

Network Slicing example: eMBB low latency

- eMBB low latency Slice template is designed against certain Service level (e.g. speed, latency) and added to offering
- Customer orders Slice for certain capacity
- Slice template descriptors is decomposed to actions for different domain subnets
 - Network resource allocation and instantiation via NFVO&VNFM
 - NF(SLA configuration/parameter) provisioning via NFMF
 - Connectivity is created between/inside Data Centers through Transport Subnets and traffic prioritization and routing rules are set for User plane (using SDN Controller)
- NSSAI is provisioned from UDM/UDR for those UEs that are allowed to access this service
- NFMF correlates certain individual NE level faults/performance info into slice/tenant level and forwards to NSSMF. In addition to Slice monitoring NSSMF can trigger closed loop action to fine tune the slice parameters.

The path to 5G contains much more than radio

7 closely synchronized streams towards 5G network

Thank you

5G NSA-3x
